Revision History

Name	Date	Reason For Changes	Version

1. Introduction

1.1 Purpose

This Software Requirements Specification (SRS) document describes the software requirements for InternX, a student-only micro-internship platform. It defines the functional and non-functional requirements for the first release (Version 1.0) of the system. This document covers the complete system, including all core platform features such as student registration and verification, profile management, project posting, project applications, AI-based skill testing, and progress tracking.The document specifies the expected system behavior, user interactions, and constraints that developers, testers, and project supervisors must follow during the design and implementation of InternX.

1.2 Document Conventions

The following conventions are used throughout this Software Requirements Specification document:

- Section headings and subheadings follow a numbered hierarchical structure for easy reference.
- Functional requirements are uniquely identified using labels in the format REQ-XX.
- The keyword "shall" is used to indicate mandatory system requirements.
- System features are organized into description and priority, stimulus/response sequences, and functional requirements.
- Priority levels are defined as:

  High – essential functionality required for system operation.

  Medium – important features that improve functionality but are not critical.

  Low – optional or enhancement features.

1.3 Intended Audience and Reading Suggestions

This document is intended for the following audiences:

Developers: Use this document to understand system functionality and implement system components.

Project Supervisors / Instructors: Review the document to evaluate system design, requirements clarity, and project feasibility.

Testers: Use the requirements to design test cases and verify system functionality.

Project Team Members: Refer to this document to ensure all members share a common understanding of the system requirements.

Reading Suggestions

Readers are advised to follow this sequence when reading the document:

- Section 1 – Introduction: Provides the purpose and overview of the document.
- Section 2 – Overall Description: Describes the system environment, user classes, and high-level system functions.
- Section 3 – External Interface Requirements: Explains how the system interacts with users, hardware, and other software systems.
- Section 4 – System Features: Contains detailed functional requirements for each feature.
- Section 5 – Nonfunctional Requirements: Specifies system performance, security, and quality attributes.

1.4 Product Scope

InternX is a web-based platform designed to connect verified university students with businesses seeking short-term project assistance or micro-internships. The system provides a structured environment where students can gain practical experience while businesses can access affordable entry-level talent. The platform directly supports the broader goal of bridging the gap between academic learning and industry readiness by providing students with real-world experience opportunities.

The platform offers the following key capabilities:

- A student-only verified environment through university email or student ID verification
- Short-term micro-internships lasting approximately 1–2 weeks
- AI-based skill testing and live anti-cheating monitoring before application
- Skill-based project matching between students and businesses using AI
- Structured project execution and progress tracking
- Fair competition through controlled application limits
- Performance-backed skill badges awarded on verified task completion

The primary objectives of the InternX platform are to:

- Provide students with practical industry experience
- Enable businesses to access reliable and affordable talent
- Create a fair and structured internship marketplace

2. Overall Description

2.1 Product Perspective

InternX is a new standalone web platform developed to address the lack of a dedicated student-only internship marketplace. It connects verified university students with businesses for short-term projects, verifying student eligibility, managing project listings and applications, and tracking project progress.

Major Components:

- Student Management Module – registration, verification, profile management
- Business Management Module – project posting and applicant review
- Project Management Module – allocation, application limits, progress tracking
- AI Evaluation Module – skill tests and live proctoring
- Database System – stores users, projects, and activity logs

The Student Management, Business Management, and Project Management modules all interact through the Database System. The AI Evaluation Module supports the Student Management Module during verification and the Project Management Module during application skill testing.

External Interactions: Web browsers, email services, backend server, and camera hardware for AI proctoring.

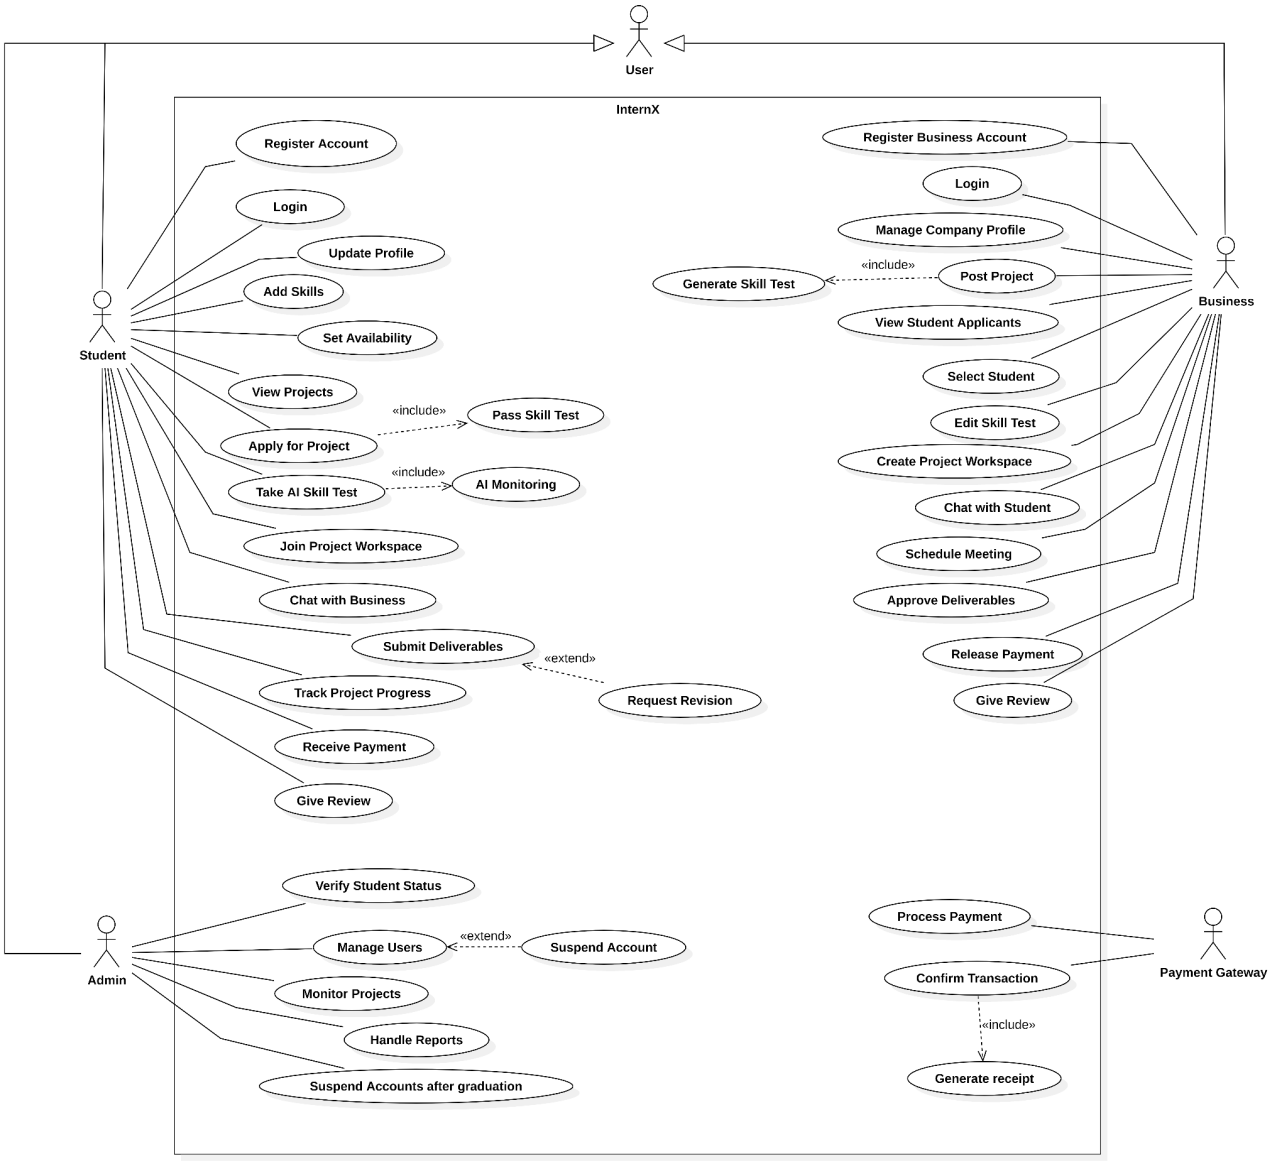
2.2 Product Functions

At a high level, InternX provides the following major functions:

- Student registration, verification, and profile creation
- Business registration, project posting, and applicant review
- AI skill test creation and live camera-based monitoring
- Student application submission (restricted to one active project, max 10 applicants per project)
- AI-based skill matching and recommendation
- Project allocation, progress tracking, paid meetings, and performance-backed skill badges

- Fixed pricing rules and payment control to ensure fair compensation

These functions enable efficient project discovery, fair selection processes, and structured student experience building. The following use case diagram illustrates the major functions



2.3 User Classes and Characteristics

The system will be used by three main classes of users:

1. Students (Primary Users)

Students are the main users of the platform. They create profiles, browse projects, and apply for internships.

Characteristics:

- Currently enrolled BS or MS students
- Basic familiarity with web applications
- Limited professional experience
- Require a simple and intuitive interface
- Interact frequently with profile creation, project search, and application submission functions

2. Businesses / Employers

Businesses use the platform to post projects and select suitable student candidates.

Characteristics:

- Startup founders, small companies, or project managers
- Moderate familiarity with online platforms
- Interested in affordable and reliable short-term assistance
- Interact with project posting, applicant review, and selection functions

3. System Administrators

Administrators manage and monitor the platform to ensure compliance with platform policies.

Characteristics:

- Technical or administrative staff
- High system privileges
- Responsible for student account verification
- Interact with the system to review and approve or reject student verification requests

2.4 Operating Environment

InternX will operate in a standard web-based environment, accessible across multiple devices and platforms.

Hardware Platforms:

- Desktop computers and laptops
- Smartphones and tablets
- Devices with a functioning camera (required for AI-based proctoring during skill tests)

Software Environment:

- Frontend: React.js 18, HTML5, CSS3, JavaScript (ES6+)
- Backend: Node.js 18 LTS, Express.js 4.x
- Database: MongoDB 6.0
- Authentication: JSON Web Tokens (JWT)

- AI/ML: Python 3.10 or later, OpenCV 4.x, Mediapipe 0.10 (for proctoring); NLP libraries (for skill test generation)
- Development Tools: Visual Studio Code, Git, GitHub, Postman for API testing

Operating Systems Supported:

- Windows 10, 11
- macOS 12 (Monterey) or later
- Ubuntu 20.04 or later
- Android 10 or later (via modern web browsers)
- iOS 14 or later (via modern web browsers)

The system will be accessed through modern web browsers such as Google Chrome, Microsoft Edge, or Firefox, ensuring cross-platform compatibility.

2.5 Design and Implementation Constraints

The development and operation of InternX are subject to the following constraints:

- The system will be implemented as a web application using React.js (frontend) and Node.js (backend).
- MongoDB will be used for data storage.
- Authentication must use secure token-based (JWT) authentication, and passwords must be stored encrypted.
- Only verified university students can participate.
- Students can work on one project at a time, and each project is limited to 10 applicants.
- AI skill testing and proctoring modules will be implemented in Python using OpenCV and Mediapipe, running locally or via Google Colab.
- The system must support modern web browsers on desktops, laptops, and mobile devices.
- Camera access is required for skill test proctoring; users without camera access cannot take skill tests.
- Student accounts shall be automatically suspended six months after the recorded graduation date.

2.6 User Documentation

The following documentation will be provided with the system:

- **User Guide** : Instructions for students and businesses on how to use the platform. Delivered as a web-based HTML document and downloadable PDF.
- **Online Help Section** :Integrated help pages explaining key platform features, accessible from within the platform.
- **FAQ Section** :Answers to common questions related to registration, applications, and project management, available as a web page within the platform.

2.7 Assumptions and Dependencies

Assumptions:

- Students possess valid university email addresses or student ID cards for verification.
- Users have access to stable internet connectivity.
- Businesses provide accurate project descriptions and requirements.
- Students have access to a functioning camera for AI-based proctoring during skill tests.

Dependencies:

- Email services for account verification.
- Web browsers for accessing the platform.
- Cloud or hosting infrastructure for server deployment.
- Third-party libraries used in frontend and backend development.
- Python environment (local or Google Colab) for AI and computer vision modules.
- If any assumptions are invalid or dependencies change, certain system features may require modification or may not function as intended.

3. External Interface Requirements

3.1 User Interfaces

The InternX platform has a new web-based graphical user interface to create user-friendliness, consistency and accessibility. The interface is arranged in a well-organized SaaS-type design like business sites like Upwork and other sites offering modern markets of services.

3.1.1 General UI Characteristics

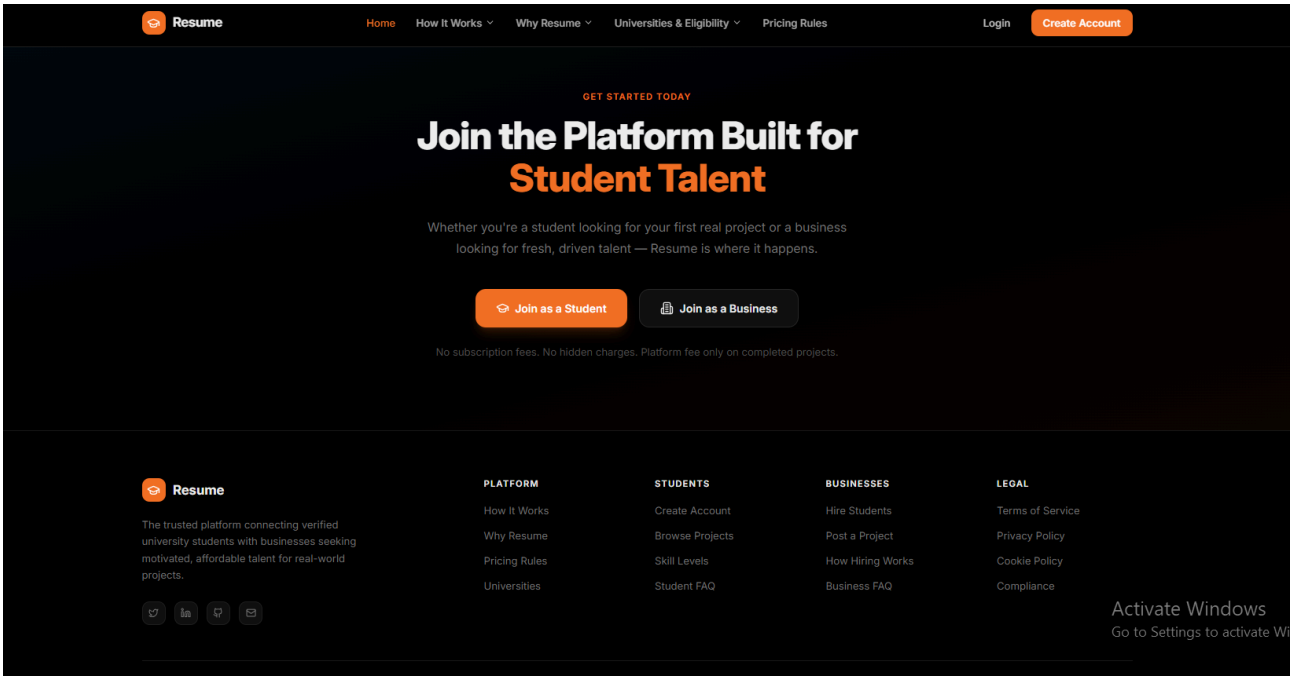
The site will be based on a responsive web interface, which is compatible with desktop and mobile browsers. The design is also created in the same color scheme based on the base color (#000000, #505050, #737373, #EEEEEE) and an accent color (#F46F25, #073857) to ensure visual continuity between all the pages.

The interface is card-based and has a very clear navigation and well-organized items. Every page has regular spacing, rounded user interface, and organised content blocks.

3.1.2 Navigation Structure

All the public pages have the main navigation bar that contains:

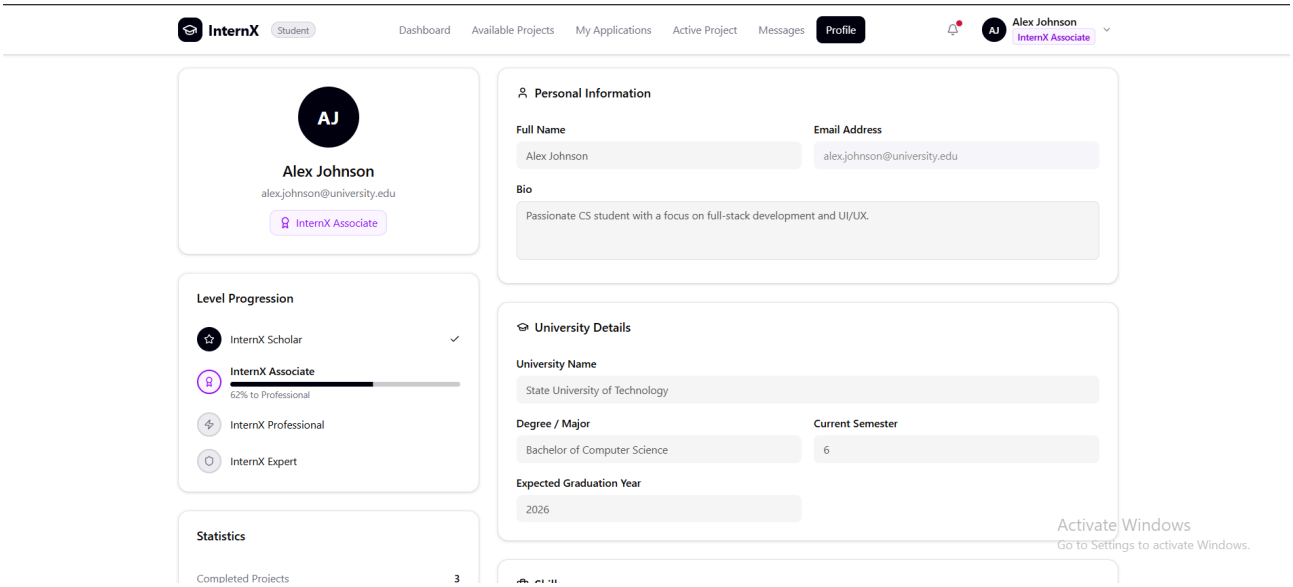
- Logo on the left side
- In the middle (Home, How It Works, Why InternX, Universities and Eligibility, Pricing Rules), there are navigation links.
- On the right hand side there are Login and Create Account buttons.



Upon log in, the navigation varies depending on the user.

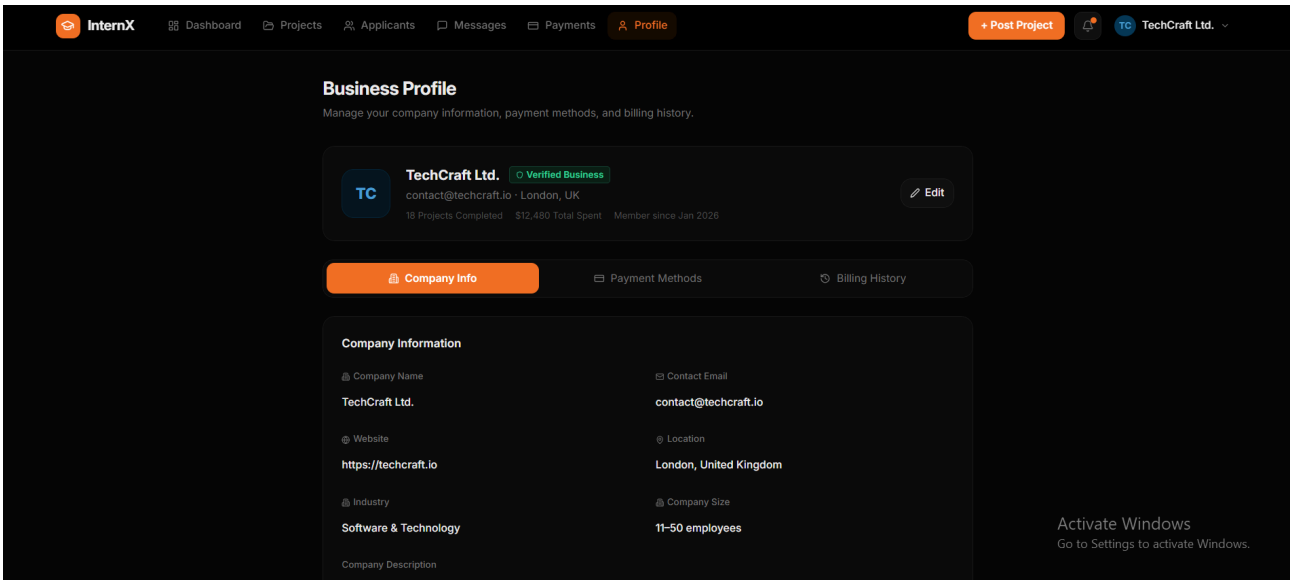
Student Navigation:

- Dashboard
- Available Projects
- My Applications
- Active Project
- Messages
- Profile



Business Navigation:

- Dashboard
- Projects
- Applicants
- Messages
- Payments
- Profile



3.1.3 Screen Layout Standards

The majority of the pages are designed to have three sections:

- **Header:** Platform branding and page links on a navigation bar.
- **Main Content Area:** Shows dashboards, project details, application forms or workspace applications.
- **Footer:** Has platform-related details, support links and legal pages.

3.1.4 Standard UI Components

- The platform will also have standard UI components that will include:
- Buttons (primary action buttons with accent color)
- Form inputs for user data
- Project cards and profile cards.
- Project progress status indicators.
- Messages and notification alerts.

3.1.5 Error Report and Standards of validation

Where invalid data is keyed in, it will show error messages in a clear manner that is near the input fields. Examples include:

- Invalid email format

- Missing required fields
- Verification of the uploading failure.

Validation messages will be brief and will inform the user on how to rectify the inputs.

Required User Interfaces

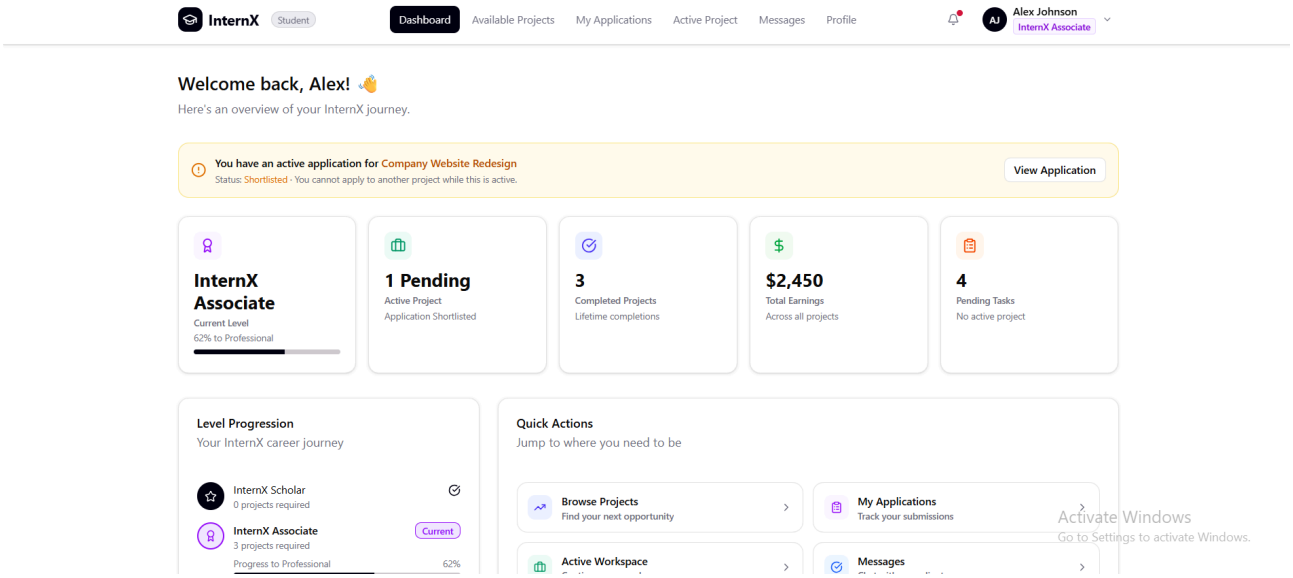
The system must have interfaces of the following components:

Public Interface

- Home Page
- How It Works Page
- Eligibility and Pricing Pages.
- Registration Pages and Login Pages.

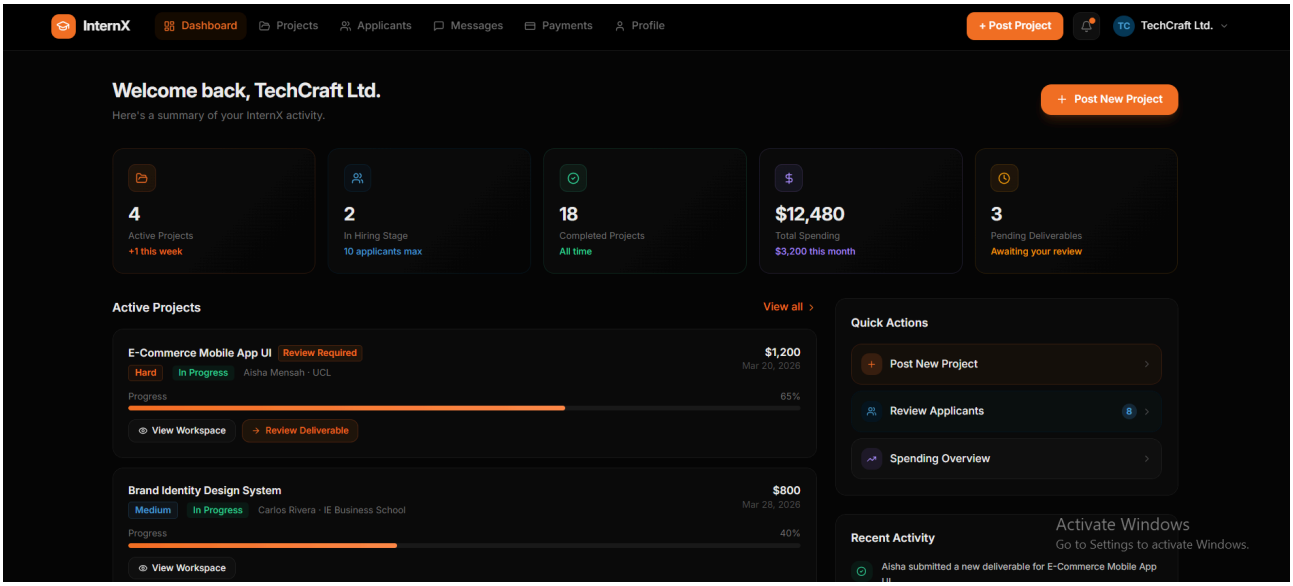
Student Interface

- Student Dashboard
- Available Projects Page
- Project Workspace
- Deliverable Submission Page.
- Profile Management Page



Business Interface

- Business Dashboard
- Project Creation Page
- Applicant Management Page
- Project Workspace
- Payment Release Page



Finer UI designs and screen designs are recorded in the User Interface Design Specification.

3.2 Hardware Interfaces

InternX is an online system and it does not need any direct communication with particular hardware equipment.

The system however supports standard hardware components which are used by the users to access the platform such as:

- Laptop and desktop computers.
- Mobility devices (smartphones and tablets).
- Input devices (keyboard, mouse, touch interfaces and so on).

Identity verification documents can also be uploaded by the users through cameras or file upload feature on their devices.

The system will be run on the regular cloud-based servers that will handle database transactions, business logic, and user interfaces.

3.3 Software Interfaces

InternX communicates with various software elements that would make the platform functional.

3.3.1 Operating System Interface

The system operates on web servers that can operate based on the following operating systems:

- Linux server platform environments.
- Windows server environments.

3.3.2 Database Interface

The data stored in internX, through the relational database management system, is used to manage the platform data, which includes:

- User accounts
- Project details
- Applications
- Messages
- Reviews and ratings

Examples of supported databases are:

- MySQL
- PostgreSQL

3.3.3 Web Application Technologies

The platform supports web technologies such as:
- Chrome, Firefox, Edge, and Safari web browsers.
- User interface rendering frameworks.
- Application logic and API management Backend server frameworks.

3.3.4 Software Components External

InternX could be combined with such other services as:
- Secure payment processing payment gateways.
- Account verification and notification services via email.
- Deliverables and document upload file storage systems.

These elements may communicate using APIs and secure channels of communication.

3.4 Communications Interfaces

InternX uses internet-based communication protocols in all the interactions between the system and users.

3.4.1 Network Communication

The platform supports communication on conventional internet protocols such as:

HTTP / HTTPS
Applied in the safe transmission of information between the users browsers and the web server.

The use of HTTPS encryption means that any sensitive data including login credentials and information about payments is safe.

3.4.2 Notifications and Messaging

The site has got internal messaging feature, which gives the students and the businesses the ability to converse using a built in chat system.

The characteristics of communications are:
- Real-time messaging
- File sharing
- Meeting scheduling

3.4.3 Email Communication

Email services are used for:
- Account verification
- Password recovery
- Project notifications
- Payment confirmations

3.4.4 Security and Encryption

Any communication between the clients and the servers will be through secure encryption protocols like:

TLS (Transport Layer Security)
This offers security to confidential data like personal information, authentication keys and card details.

3.4.5 Data Synchronization

Real-time updates can be applied to the following features:
- Messaging systems
- Project progress tracking
- Workspace activity updates

These messages are used to keep students and businesses informed on the activities of the project in time.

4. System Features

4.1 Student Registration and Verification

4.1.1 Description and Priority

This feature allows university students to register on the Resume Internship Platform and verifies that only currently enrolled students gain access. Verification is performed through a university email domain or student ID card upload.
Priority: High

4.1.2 Stimulus/Response Sequences

Student Registration
Student selects "Sign Up as Student."
Student enters name, email, and password.
System checks if the email belongs to a recognized university domain.

Email Verification
If the email is valid, the system sends a verification email.
Student confirms the email through the verification link.
System activates the student account.

Alternative Verification
If a university email is not used, the student uploads a student ID card.
The admin or automated system reviews the proof.
The system activates the account after successful verification.

4.1.3 Functional Requirements

REQ-1: The system shall allow students to register using their name, email, and password.
REQ-2: The system shall verify whether the email address belongs to an approved university domain.
REQ-3: The system shall send an email verification link to the registered email address.
REQ-4: The system shall allow students to upload a student ID card if a university email is not available.
REQ-5: The system shall allow an admin or automated system to verify uploaded student ID documents.
REQ-6: The system shall activate the student account only after successful verification.
REQ-7: The system shall reject invalid or duplicate email addresses.
REQ-8: The system shall suspend student accounts six months after the graduation date.

4.2 Student Profile Creation

4.2.1 Description and Priority

This feature allows verified students to create a professional profile containing academic details, skills, and availability information so that businesses can evaluate them for projects.
Priority: High

4.2.2 Stimulus/Response Sequences

Verified student logs into the platform.
System redirects the student to the profile creation page.
Student enters personal and academic details.
Student selects skills from the predefined skill list.
Student sets an availability calendar including exam dates.
Student submits the profile.
System validates the data and publishes the profile.

4.2.3 Functional Requirements

REQ-1: The system shall allow verified students to create and update their profiles.
REQ-2: The system shall allow students to add academic information including degree, semester, and university.
REQ-3: The system shall provide a predefined list of skills for selection.
REQ-4: The system shall prevent students from selecting irrelevant or excessive skills.
REQ-5: The system shall allow students to set availability schedules.
REQ-6: The system shall store profile data in the system database.
REQ-7: The system shall display student profiles to businesses after successful submission.

4.3 Project Posting by Businesses

4.3.1 Description and Priority

This feature allows businesses to create and publish project opportunities for students. Businesses provide project details including required skills, difficulty level, and contract type.
Priority: High

4.3.2 Stimulus/Response Sequences

Business logs into the platform.
Business selects Create Project.
Business enters project details, required skills, and difficulty level.
Business selects contract type (hourly or fixed price).
System validates the information.
Project is published on the platform.

4.3.3 Functional Requirements

REQ-1: The system shall allow businesses to create project listings.
REQ-2: The system shall allow businesses to specify required skills and project difficulty levels.

REQ-3: The system shall support hourly and fixed-price contracts.
REQ-4: The system shall validate project details before publishing.
REQ-5: The system shall display published projects to eligible students.
REQ-6: The system shall allow admins to moderate or remove inappropriate projects.

4.4 Project Application and Allocation

4.4.1 Description and Priority

This feature allows students to apply for projects and enables businesses to select the most suitable candidate.
Priority: High

4.4.2 Stimulus/Response Sequences

Student views available projects.
Student selects a project and submits an application.
System checks eligibility and application limits.
System allows a maximum of 10 applicants per project.
Business reviews applications.
Business selects one student.
System closes remaining applications automatically.

4.4.3 Functional Requirements

REQ-PAA-1: The system shall allow students to apply for available projects.
REQ-PAA-2: The system shall restrict students to one active project application at a time.
REQ-PAA-3: The system shall limit each project to a maximum of 10 applicants.
REQ-PAA-4: The system shall allow businesses to review applicant profiles.
REQ-PAA-5: The system shall allow businesses to select one applicant.
REQ-PAA-6: The system shall automatically close remaining applications after selection.

5. Other Nonfunctional Requirements

5.1 Performance Requirements

- The system shall respond to user actions within 2–3 seconds under normal conditions.
- The platform shall support at least 1000 concurrent users.
- Chat messages shall be delivered in real time.
- Project search results shall load within 3 seconds.

5.2 Safety Requirements

- The system shall perform regular database backups to prevent data loss.
- The system shall store project files and deliverables securely.
- The system shall ensure that unfinished projects are not lost due to unexpected failures.
- The system shall detect inactivity and notify users if deadlines are at risk.

5.3 Security Requirements

- The system shall require users to authenticate using a valid email and password.
- The system shall encrypt user passwords before storing them in the database
- The system shall restrict project access to authorized users only.
- The system shall allow administrators to suspend accounts that violate platform rules.

5.4 Software Quality Attributes

5.4.1 Usability

The platform interface shall be simple and intuitive so that students and businesses can easily navigate and perform tasks.

5.4.2 Reliability

The system shall operate with minimal downtime and maintain consistent performance.

5.4.3 Scalability

The system shall support growth in the number of students, businesses, and projects.

5.4.4 Maintainability

The system architecture shall allow easy updates and maintenance.

5.5 Business Rules

- Only verified university students are allowed to work on the platform.
- Students may work on only one project at a time.
- Each project may have a maximum of 10 applicants.
- Student accounts are automatically suspended six months after graduation.
- Businesses must approve deliverables before releasing payment.
- Skill level upgrades depend on the number and difficulty of completed projects.

6. Other Requirements

6.1 AI Module Requirements

The platform includes AI-based modules responsible for skill test generation, monitoring, and candidate matching. The AI system should generate skill tests automatically based on the project task description provided by businesses. These tests must evaluate relevant skills required for the project.

The AI monitoring system should analyze webcam input during tests to detect suspicious behavior such as looking away frequently, presence of multiple faces, or abnormal movements that may indicate cheating. The system should flag such behavior for review by the platform administrator.

The AI matching module should recommend suitable students for projects based on verified skills, academic level, availability, and past performance.

6.2 Student Eligibility Policy

Only currently enrolled **BS or MS university students** are allowed to register on the platform. Student verification must be completed through either:

- Official university email verification, or
- Submission of a valid university student ID.

Accounts may be automatically suspended **six months after the recorded graduation date** to ensure the platform remains student-focused.

6.3 Project Participation Rules

To maintain fair opportunities for all students:

- A student may **only work on one active project at a time**.
- Businesses can select **only a limited number of applicants** for each project.
- Projects must follow predefined **difficulty and pricing guidelines** defined by the platform.

6.4 Payment and Transaction Policies

All payments between businesses and students must be processed through the platform's integrated **payment gateway**. Payments are released only after the business confirms that the submitted deliverables meet the project requirements.

The platform may charge a small **service fee or commission** on completed transactions.

6.5 Ethical and Privacy Considerations

The system must ensure the **privacy and security of user data**, especially during AI monitoring of skill tests. Webcam monitoring should only be active during the test session and must not store unnecessary video data.

All personal information such as student identity documents, payment details, and communication records must be stored securely and used only for platform functionality.

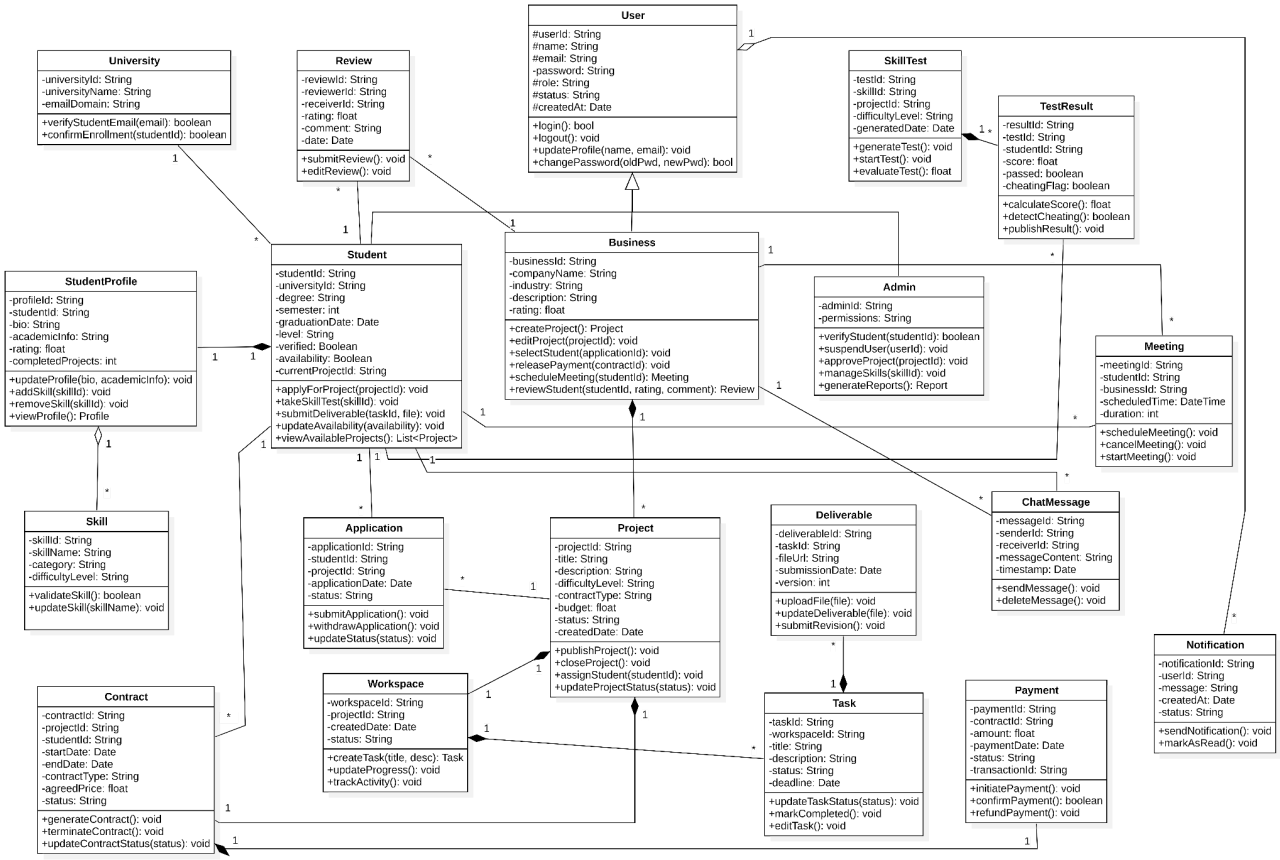
Appendix A: Glossary

BS/MS: Bachelor of Science / Master of Science
JWT: JSON Web Token, used for secure token-based authentication
AI/ML: Artificial Intelligence / Machine Learning techniques applied for skill tests and matching
NLP: Natural Language Processing, used to generate skill test questions from project descriptions
API: Application Programming Interface
LTS: Long Term Support
OpenCV: Open-source computer vision library for real-time proctoring
MediaPipe: Framework for AI-based pose and face tracking, used in skill test monitoring

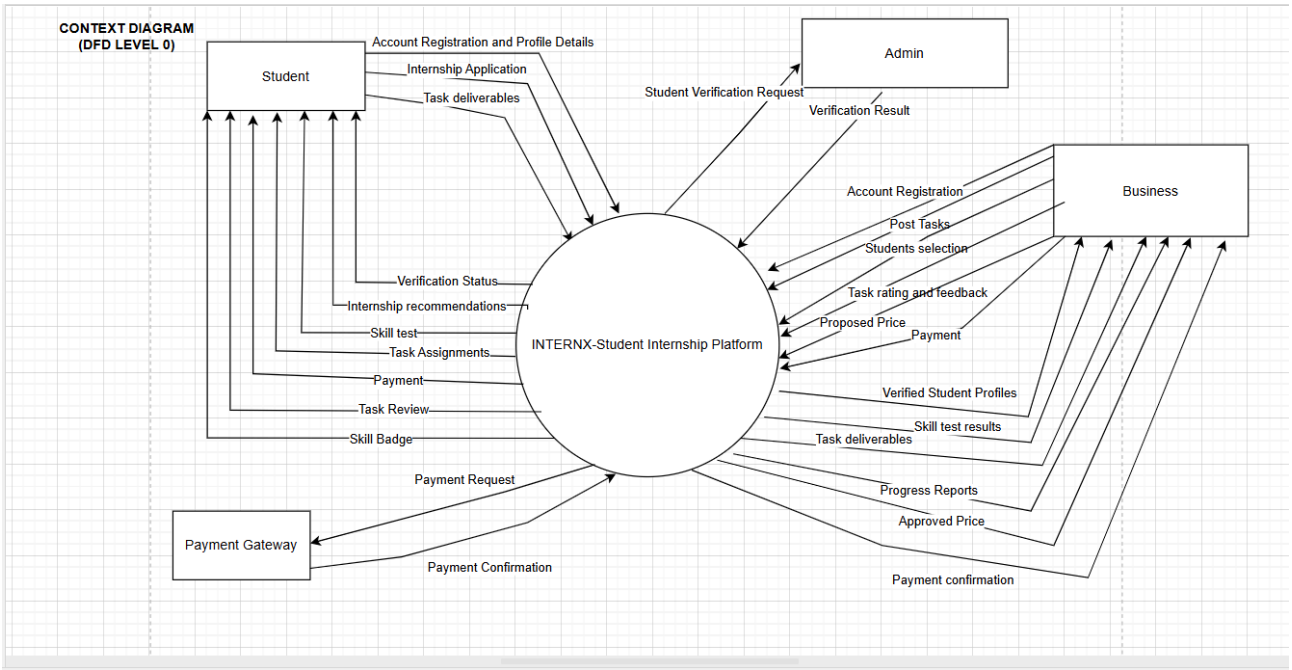
Micro-internship: Short-term internship lasting 1–2 weeks
Skill Badge: Digital credential awarded based on verified task completion
AI Monitoring: A system that uses computer vision to observe student behavior during skill tests to detect possible cheating
Skill Test: An automatically generated assessment designed to evaluate a student's ability to perform a specific task related to a project
Project Workspace: A dedicated interface where students and businesses manage tasks, communicate, submit deliverables, and track progress.
Deliverable: A piece of work or output submitted by a student as part of completing a project task.
Payment Gateway: An external service that securely processes online payments on the platform
Authentication: The process of verifying the identity of users when they log into the platform
Authorization: The process of determining what actions a user is allowed to perform within the system based on their role
Computer Vision: A field of artificial intelligence that allows computers to analyze images or video

Appendix B: Analysis Models

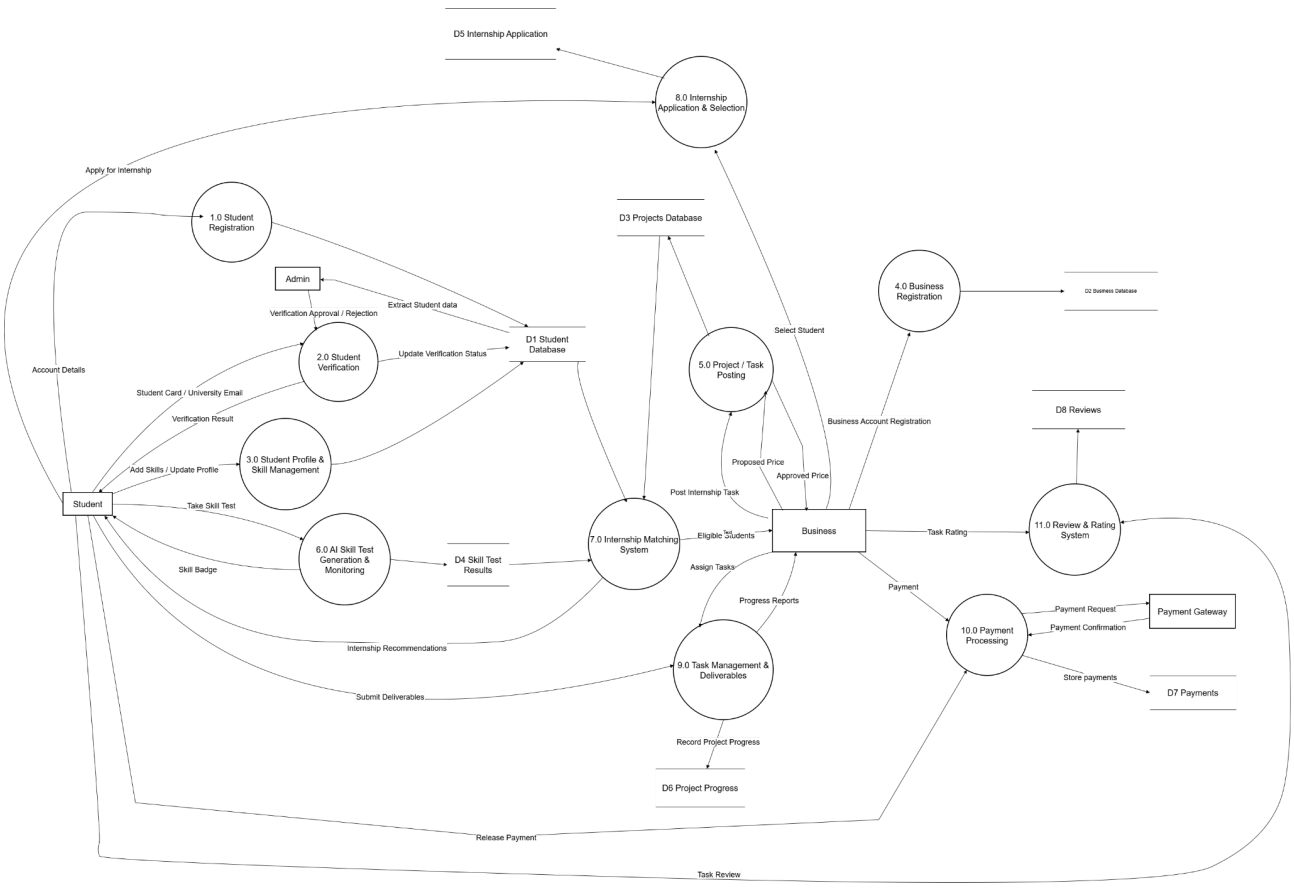
B.1: Class Diagram



B.2: Data Flow Diagram-Level 0 (DFD0)



B.3: Data Flow Diagram-Level 1 (DFD1)



Appendix C: To Be Determined List

At the time of writing this document, no TBD items remain, and all requirements described in this SRS are considered defined.
